

1

(a) Sample Space S

The sample space S in this experiment consists of all possible outcomes when rolling a pair of dice, one green and one red. Since each die has 6 faces, the total number of outcomes is $6 \times 6 = 36$. The sample space is represented as pairs (x,y), where x is the outcome on the green die and y is the outcome on the red die.

Sample Space S:

$= \{(1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (2,1), (2,2), \dots, (6,5), (6,6)\}$
 $S = \{(1,1), (1,2), (1,3), (1,4), (1,5), (1,6), (2,1), (2,2), \dots, (6,5), (6,6)\}$

(b) Event A: Sum Greater than 8

Event A:

$= \{(3,6), (4,5), (4,6), (5,4), (5,5), (5,6), (6,3), (6,4), (6,5), (6,6)\}$
 $A = \{(3,6), (4,5), (4,6), (5,4), (5,5), (5,6), (6,3), (6,4), (6,5), (6,6)\}$

(c) Event B: A 2 on Either Die

Event B:

$= \{(1,2), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (3,2), (4,2), (5,2), (6,2)\}$
 $B = \{(1,2), (2,1), (2,2), (2,3), (2,4), (2,5), (2,6), (3,2), (4,2), (5,2), (6,2)\}$

(d) Event C: Number Greater than 4 on Green Die

Event C:

$= \{(5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6)\}$
 $C = \{(5,1), (5,2), (5,3), (5,4), (5,5), (5,6), (6,1), (6,2), (6,3), (6,4), (6,5), (6,6)\}$

(e) Event $A \cap C$: Intersection of A and C

Event $A \cap C$:

$= \{(5,4), (5,5), (5,6), (6,3), (6,4), (6,5), (6,6)\}$
 $A \cap C = \{(5,4), (5,5), (5,6), (6,3), (6,4), (6,5), (6,6)\}$

(f) Event $A \cap B$: Intersection of A and B

Event $A \cap B$: $= \{(4,6), (5,5), (5,6), (6,2), (6,5), (6,6)\}$
 $A \cap B = \{(4,6), (5,5), (5,6), (6,2), (6,5), (6,6)\}$

(g) Event $B \cap C$: Intersection of B and C

Event $B \cap C$: $=\{(5,2),(6,2)\}$ $B \cap C = \{(5,2),(6,2)\}$

2. (a) No Mechanical Problems (M), No Ticket (T), Campsite with No Vacancies (V)

This would be the area that is only in the V circle and not in M or T.

Region: 8

(b) Mechanical Problems (M) and Trouble Finding Campsite (V), No Ticket (T)

This would be the area where M and V circles overlap but not T.

Region: 6

(c) Either Mechanical Trouble (M) or No Vacancies (V), No Ticket (T)

This would be all the areas in circles M and V that do not overlap with T. This includes the exclusive parts of M and V, and their intersection.

Regions: 2, 6, 8

(d) Will Arrive at a Campsite with Vacancies

This includes all the regions outside of V.

Regions: 1, 2, 3, 4, 5, 7

These are the regions of the Venn diagram that correspond to the given events.

3.

(a) Number of Ways to Line Up 6 People

There are 720 ways to line up 6 people to get on a bus.

(b) If 3 Specific Persons Insist on Following Each Other

If 3 specific persons insist on following each other, there are 144 possible ways to arrange them along with the other 3 people.

(c) If 2 Specific Persons Refuse to Follow Each Other

If 2 specific persons refuse to follow each other, there are 480 possible ways to arrange all 6 people.

4.

(a) Arranging 8 Covered Wagons in a Circle

There are 5,040 ways to arrange 8 covered wagons from Arizona in a circle.

(b) Arranging Trees Along a Property Line

There are 1,260 ways to arrange 3 oaks, 4 pines, and 2 maples along a property line without distinguishing among trees of the same kind.

5.

(a) Unique Poker Hands

The number of unique poker hands that can be drawn from a standard 52-card deck is given by the combination formula:

$$\text{Combinations} = \frac{n!}{r!(n-r)!}$$

Where n is the total number of items to choose from, in this case, 52 cards, and r is the number of items to choose, in this case, 5 cards for a poker hand.

$$\text{Unique Poker Hands} = \frac{52!}{5!(52-5)!}$$

There are 2,598,960 unique poker hands that one can draw from a standard 52-card deck.

(b) Full House

A full house consists of three cards of one rank and two cards of another rank. There are 13 ranks and 4 cards of each rank. To choose a full house:

1. Choose the rank for the three of a kind (13 options).
2. Choose 3 out of the 4 cards from this rank ($\frac{4!}{3!1!} = 4$ ways).
3. Choose the rank for the pair (12 remaining options).
4. Choose 2 out of the 4 cards from this second rank ($\frac{4!}{2!2!} = 6$ ways).

The total number of ways to get a full house is the product of these choices.

There are 3,744 different ways to have a full house in a poker hand.

(c) **Three of a Kind**

For a three of a kind hand (not a full house), you must:

1. Choose the rank for the three of a kind (13 options).
2. Choose 3 out of the 4 cards from this rank ($(43)(34)$ ways).
3. Choose ranks for the two single cards (from the remaining 12 ranks, this is $(122)(212)$ ways).
4. For each of these two chosen ranks, select one card ($(41) \times (41)(14) \times (14)$ ways).

The total number of ways to get a three of a kind hand is the product of these choices.

There are 54,912 different ways to have a three of a kind in a poker hand, where the other two cards do not form a pair.
